It is imperative that locations of framing members do not conflict with locations of recessed light fixtures.

5d. General Contractor shall install all appliances specified and all equipment specified according to the respective manufacturer's instructions. All instruction booklets, warrantees, and other information regarding appliances and equipment shall be handed directly to the Owner in a manila envelope at the time of substantial completion. Contractor shall verify that every appliance and every piece of equipment is in perfect working order and that information about all warranties and guarantees is made known to the Owner.

5e. The installer of each major unit of work is required to inspect the substrate and conditions to receive work and shall report all unsatisfactory conditions to the General Contractor and shall not proceed until satisfactory conditions are attained.

5f. No work shall commence with unapproved materials. Any work done with un-approved materials and equipment is at the contractor's risk. See specifications for submittal and substitution requirements.

5g. Construction materials stored on the site shall be properly stacked and protected so as to prevent damage or deterioration until used. Failure in this regard may be cause for rejection of material and/or work.

5h. New/existing finishes and construction shall be protected by the contractor from potential damage caused by construction activity. Damage to finishes or construction caused in this manner shall be repaired or replaced (owner's decision) by the contractor with identical material and/or finishes. Contractor shall make and maintain a photographic record notebook with dated/indexed photographs.

5i. In addition to those shown on drawings, provide and locate access doors or panels in ceiling and wall construction as required by mechanical, plumbing, and electrical work.

TYPICAL SUSPENDED CEILING NOTES:

The following notes will be acceptable in plans and specifications for ceiling systems whose total weight including conditioning grilles and light fixtures does not exceed four (4) systems and those supporting lateral loads from partitions will require special design details. 12 ga. (min.) hanger wires may be used for up to and including 4' x 4' grid spacing along main runners.

1.) Provide 12 ga. hanger wires at the ends of all main and cross runners within 8" from the support or within 1/4 of the length of the end tee, which ever is least, for the perimeter of the ceiling area. End connections for runners which are designed and detailed to resist the applied horizontal forces may be used in lieu of the 12 ga. hanger wires subject to the architect review and approval.

2.) Provide trapeze or other supplementary support members at obstructions to main hangers, struts or braces as required at all ceiling breaks, soffits or discontinuous areas. Hanger wires that are more than 1 in 6 out of plumb are to have counter-sloping wires.

3.) Ceiling grid members may be attached to no more than 2 adjacent walls. Ceiling grid members should be at least 1/2 inch free of other walls. If walls run diagonally to ceiling grid system runners, one end of main and cross runners should be free and a minimum of 1/2 inch clear of wall.

4.) At the perimeter of the ceiling area where main or cross runners are not connected to the adjacent wall, provide interconnection between the runners at the free ends to prevent lateral spreading. A metal strut or a 16 ga. wire with positive mechanical connection to the runner may be used. Where the perpendicular distance from the wall to the first parallel runner is 12" or less, this interlock is not required.

5.) Provide sets of four 12 ga. splayed bracing wires oriented 90° from each other at the following spacing:
a.) Place sets of bracing wires at a spacing not more than 12' x 12" on center.
b.) Provide bracing wires at locations not more than 6' from each perimeter wall and at the edge of vertical ceiling offsets. The slope of bracing wires should not exceed 45° from the plane of the ceiling and should be taut without causing the ceiling to lift. Splices in bracing wires are not to be permitted.

6.) Fasten hanger wires with not less than 3 tight turns. Fasten bracing wires with 4 tight turns. Make all tight turns within a distance of 1-1/2 inches. Hanger or bracing wire anchors to the structure should be installed in such a manner that the direction of the wires align as closely as possible with the direction of the forces acting on the wire. Note: Wire turns made by machine where both strands have been deformed or bent in wrapping can waive the 1-1/2" requirement, but the number of turns should be maintained and be as tight as possible.

7.) Separate all ceiling hanging and bracing wires at least 6" from all unbraced ducts, pipes, conduit, etc. It is acceptable to attached lightweight items, such as a single electric conduit not exceeding 3/4" nominal diameter to hanger wires using connectors acceptable to the architect.

8.) When drilled-in concrete anchors are used in reinforced concrete for hanger wires, 1 out of 10 must be field tested for 440 pounds in tension. Shot-in anchors in concrete are not permitted. Report anchor failures to architect for further remedial instructions. Note: Drilled-in anchors require special approval when used in prestressed concrete.

9.) Attach all light fixtures to the ceiling grid runers to resist a horizonal force equal to the weight of the fixtures.

10.) Flush or recessed light fixtures and air terminals or services weighing less than 56 pounds may be supported directly on the runners of the heavy duty grid system but, in addition, they must have a minimum of two 12 ga. slack safety wires attached to the fixture at diagonal corners and anchored to the structure above. All 4 ft. x 4 ft. light fixures must have slack safety wires at each of the 4 corners.

11.) All flush or recessed light fixtures and air terminals or services weighing 56 ponds or more must be independently supported by not less than 4 taut 12 ga. wires each attached to the fixture and to the structure above regardless of the type of ceiling grid system used. The 4 taut 12 ga. wires including their attachment to the structure above must be capable of supporting 4 times the weight of the unit.

12.) All fixtures and air terminals or services supported on intermediate duty grid systems must be independently supported by not less than 4 taut 12 ga. wires each attached to the fixture or terminal and to the structure above.

13.) Support surface mounted light fixtures by at least two positive devices which surround the ceiling runner and which are each supported from the structure above by a 12 ga. wire. Spring clips or clamps that connect only to the runner are not acceptable.

14.) Provide additional supports when light fixtures are 8 feet or longer.

15.) Where occurs, support pendant mounted light fixtures directly from the structure above with hanger wires or cables passing through each pendant hanger and capable of supporting 4 times the weight of the fixture.

(4) AT THE PERIMETER OF THE CEILING AREA WHERE MAIN OR CROSS RUNNERS ARE NOT CONNECTED TO THE ADJACENT WALL, PROVIDE INTERCONNECTION BETWEEN THE RUNNERS AT THE FREE END TO PREVENT LATERAL SPREADING. A METAL STRUT OR A 16GA WIRE WITH A POSITIVE MECHANICAL CONECTION TO THE RUNNER MAY BE USED. HYDROSEEDING SHALL BE IN ACCORDANCE WITH THE PROVISIONS OF SECTION 20" EROSION CONTROL AND HIGHWAY PLANTING" OF THE STANDARD SPECIFICATION OF THE STATE OF CALIFORNIA DEPARTMENT OF TRANSPORTATION, AS LAST REVISED. REFER TO THE EROSION CONTROL SECTION OF THE GRADING SPECIFICATIONS THAT ARE A PART OF THIS PLAN SET FOR FURTHER INFORMATION.
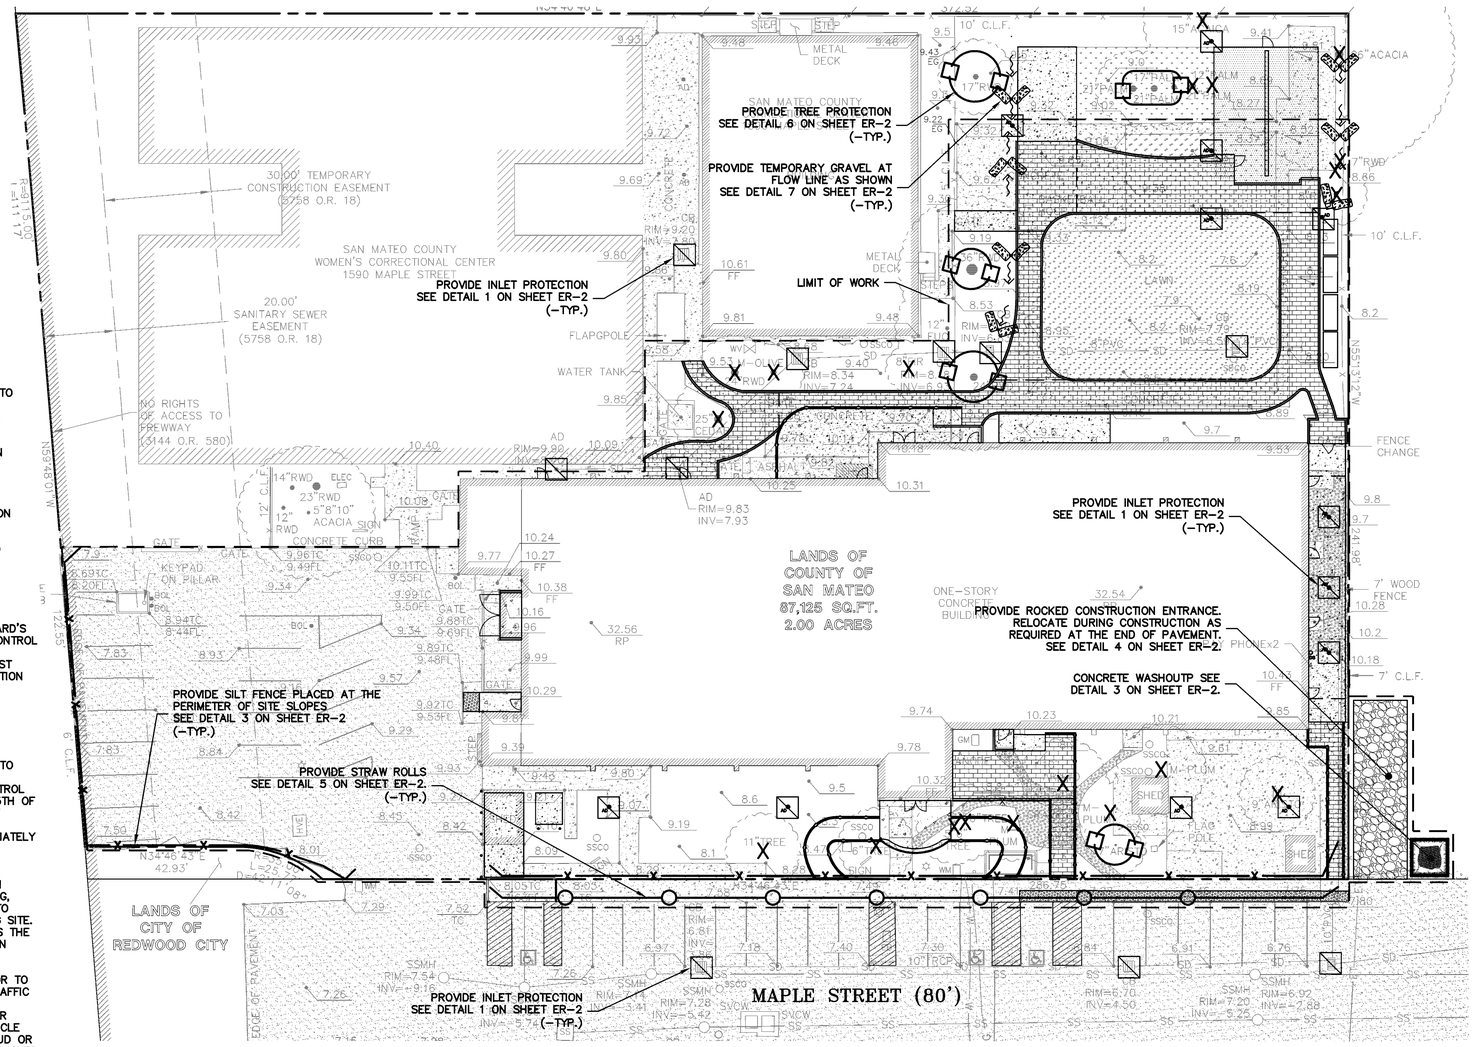
5. INLET PROTECTION SHALL BE INSTALLED AT OPEN INLETS TO PREVENT SEDIMENT FROM ENTERING THE STORM DRAIN SYSTEM. INLETS NOT USED IN CONJUNCTION WITH EROSION CONTROL ARE TO BE BLOCKED TO PREVENT ENTRY OF SEDIMENT. MINIMUM INLET PROTECTION SHALL CONSIST OF A ROCK SACKS OR AS SHOWN ON THIS PLAN
6. THIS EROSION AND SEDIMENT CONTROL PLAN MAY NOT COVER ALL THE SITUATIONS THAT MAY ARISE DURING CONSTRUCTION DUE TO UNANTICIPATED FIELD CONDITIONS. VARIATIONS AND ADDITIONS MAY BE MADE TO THIS PLAN IN THE FIELD. A REPRESENTATIVE OF LEA & BRAZE ENGINEERING SHALL PERFORM A FIELD REVIEW AND MAKE RECOMMENDATIONS AS NEEDED. CONTRACTOR IS RESPONSIBLE TO NOTIFY LEA & BRAZE ENGINEERING AND THE GOVERNING AGENCY OF ANY CHANGES.
7. THE EROSION CONTROL MEASURES SHALL CONFORM TO THE LOCAL JURISDICTION'S STANDARDS AND THE APPROVAL OF THE LOCAL JURISDICTION'S ENGINEERING DEPARTMENT.
8. STRAW ROLLS SHALL BE PLACED AT THE TOE OF SLOPES AND ALONG THE DOWN SLOPE PERIMETER OF THE PROJECT. THEY SHALL BE PLACED AT 25 FOOT INTERVALS ON GRADED SLOPES. PLACEMENT SHALL RUN WITH THE CONTOURS AND ROLLS SHALL BE TIGHTLY END BUTTED. CONTRACTOR SHALL REFER TO MANUFACTURES SPECIFICATIONS FOR PLACEMENT AND INSTALLATION INSTRUCTIONS.



PERIODIC MAINTENANCE:

1. MAINTENANCE IS TO BE PERFORMED AS FOLLOWS:
   - A. DAMAGES CAUSED BY SOIL EROSION OR CONSTRUCTION SHALL BE REPAIRED AT THE END OF EACH WORKING DAY.

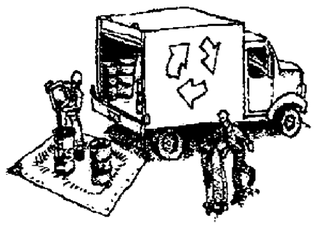
Construction Best Management Practices (BMPs)

Construction projects are required to implement the stormwater best management practices (BMP) on this page, as they apply to your project, all year long.

Materials & Waste Management



Non-Hazardous Materials

- ❑ Berm and cover stockpiles of sand, dirt or other construction material with tarps when rain is forecast or if not actively being used within 14 days.
- ❑ Use (but don't overuse) reclaimed water for dust control.

Hazardous Materials

- ❑ Label all hazardous materials and hazardous wastes (such as pesticides, paints, thinners, solvents, fuel, oil, and antifreeze) in accordance with city, county, state and federal regulations.
- ❑ Store hazardous materials and wastes in water tight containers, store in appropriate secondary containment, and cover them at the end of every work day or during wet weather or when rain is forecast.
- ❑ Follow manufacturer's application instructions for hazardous materials and be careful not to use more than necessary. Do not apply chemicals outdoors when rain is forecast within 24 hours.
- ❑ Arrange for appropriate disposal of all hazardous wastes.

Waste Management

- ❑ Cover waste disposal containers securely with tarps at the end of every work day and during wet weather.
- ❑ Check waste disposal containers frequently for leaks and to make sure they are not overfilled. Never hose down a dumpster on the construction site.
- ❑ Clean or replace portable toilets, and inspect them frequently for leaks and spills.
- ❑ Dispose of all wastes and debris properly. Recycle materials and wastes that can be recycled (such as asphalt, concrete, aggregate base materials, wood, gyp board, pipe, etc.)
- ❑ Dispose of liquid residues from paints, thinners, solvents, glues, and cleaning fluids as hazardous waste.

Construction Entrances and Perimeter

- ❑ Establish and maintain effective perimeter controls and stabilize all construction entrances and exits to sufficiently control erosion and sediment discharges from site and tracking off site.
- ❑ Sweep or vacuum any street tracking immediately and secure sediment source to prevent further tracking. Never hose down streets to clean up tracking.

Equipment Management & Spill Control

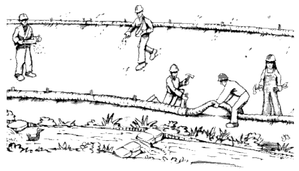
Maintenance and Parking

- ❑ Designate an area, fitted with appropriate BMPs, for vehicle and equipment parking and storage.
- ❑ Perform major maintenance, repair jobs, and vehicle and equipment washing off site.
- ❑ If refueling or vehicle maintenance must be done onsite, work in a bermed area away from storm drains and over a drip pan or drop cloths big enough to collect fluids. Recycle or dispose of fluids as hazardous waste.
- ❑ If vehicle or equipment cleaning must be done onsite, clean with water only in a bermed area that will not allow rinse water to run into gutters, streets, storm drains, or surface waters.
- ❑ Do not clean vehicle or equipment onsite using soaps, solvents, degreasers, or steam cleaning equipment.

Spill Prevention and Control

- ❑ Keep spill cleanup materials (e.g., rags, absorbents and cat litter) available at the construction site at all times.
- ❑ Inspect vehicles and equipment frequently for and repair leaks promptly. Use drip pans to catch leaks until repairs are made.
- ❑ Clean up spills or leaks immediately and dispose of cleanup materials properly.
- ❑ Do not hose down surfaces where fluids have spilled. Use dry cleanup methods (absorbent materials, cat litter, and/or rags).
- ❑ Sweep up spilled dry materials immediately. Do not try to wash them away with water, or bury them.
- ❑ Clean up spills on dirt areas by digging up and properly disposing of contaminated soil.
- ❑ Report significant spills immediately. You are required by law to report all significant releases of hazardous materials, including oil. To report a spill: 1) Dial 911 or your local emergency response number, 2) Call the Governor's Office of Emergency Services Warning Center, (800) 852-7550 (24 hours).

Earthmoving



- ❑ Schedule grading and excavation work during dry weather.
- ❑ Stabilize all denuded areas, install and maintain temporary erosion controls (such as erosion control fabric or bonded fiber matrix) until vegetation is established.
- ❑ Remove existing vegetation only when absolutely necessary, and seed or plant vegetation for erosion control on slopes or where construction is not immediately planned.
- ❑ Prevent sediment from migrating offsite and protect storm drain inlets, gutters, ditches, and drainage courses by installing and maintaining appropriate BMPs, such as fiber rolls, silt fences, sediment basins, gravel bags, berms, etc.
- ❑ Keep excavated soil on site and transfer it to dump trucks on site, not in the streets.

Contaminated Soils

- ❑ If any of the following conditions are observed, test for contamination and contact the Regional Water Quality Control Board:
  - Unusual soil conditions, discoloration, or odor.
  - Abandoned underground tanks.
  - Abandoned wells
  - Buried barrels, debris, or trash.

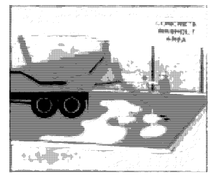
Paving/Asphalt Work

- ❑ Avoid paving and seal coating in wet weather or when rain is forecast, to prevent materials that have not cured from contacting stormwater runoff.
- ❑ Cover storm drain inlets and manholes when applying seal coat, tack coat, slurry seal, fog seal, etc.
- ❑ Collect and recycle or appropriately dispose of excess abrasive gravel or sand. Do NOT sweep or wash it into gutters.
- ❑ Do not use water to wash down fresh asphalt concrete pavement.

Sawcutting & Asphalt/Concrete Removal

- ❑ Protect nearby storm drain inlets when saw cutting. Use filter fabric, catch basin inlet filters, or gravel bags to keep slurry out of the storm drain system.
- ❑ Shovel, abosorb, or vacuum saw-cut slurry and dispose of all waste as soon as you are finished in one location or at the end of each work day (whichever is sooner!).
- ❑ If sawcut slurry enters a catch basin, clean it up immediately.

Concrete, Grout & Mortar Application

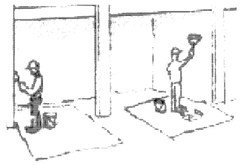


- ❑ Store concrete, grout, and mortar away from storm drains or waterways, and on pallets under cover to protect them from rain, runoff, and wind.
- ❑ Wash out concrete equipment/trucks offsite or in a designated washout area, where the water will flow into a temporary waste pit, and in a manner that will prevent leaching into the underlying soil or onto surrounding areas. Let concrete harden and dispose of as garbage.
- ❑ When washing exposed aggregate, prevent washwater from entering storm drains. Block any inlets and vacuum gutters, hose washwater onto dirt areas, or drain onto a bermed surface to be pumped and disposed of properly.

Landscaping

- ❑ Protect stockpiled landscaping materials from wind and rain by storing them under tarps all year-round.
- ❑ Stack bagged material on pallets and under cover.
- ❑ Discontinue application of any erodible landscape material within 2 days before a forecast rain event or during wet weather.

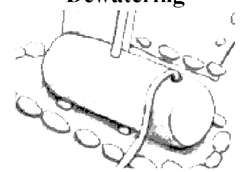
Painting & Paint Removal



Painting Cleanup and Removal

- ❑ Never clean brushes or rinse paint containers into a street, gutter, storm drain, or stream.
- ❑ For water-based paints, paint out brushes to the extent possible, and rinse into a drain that goes to the sanitary sewer. Never pour paint down a storm drain.
- ❑ For oil-based paints, paint out brushes to the extent possible and clean with thinner or solvent in a proper container. Filter and reuse thinners and solvents. Dispose of excess liquids as hazardous waste.
- ❑ Paint chips and dust from non-hazardous dry stripping and sand blasting may be swept up or collected in plastic drop cloths and disposed of as trash.
- ❑ Chemical paint stripping residue and chips and dust from marine paints or paints containing lead, mercury, or tributyltin must be disposed of as hazardous waste. Lead based paint removal requires a state-certified contractor.

Dewatering



- ❑ Discharges of groundwater or captured runoff from dewatering operations must be properly managed and disposed. When possible send dewatering discharge to landscaped area or sanitary sewer. If discharging to the sanitary sewer call your local wastewater treatment plant.
- ❑ Divert run-on water from offsite away from all disturbed areas.
- ❑ When dewatering, notify and obtain approval from the local municipality before discharging water to a street gutter or storm drain. Filtration or diversion through a basin, tank, or sediment trap may be required.
- ❑ In areas of known or suspected contamination, call your local agency to determine whether the ground water must be tested. Pumped groundwater may need to be collected and hauled off-site for treatment and proper disposal.

Storm drain polluters may be liable for fines of up to $10,000 per day!

RE: E2.1 DEMO PLAN

A THESE DEMOLITION DRAWINGS ARE INTENDED TO ASSIST THE ELECTRICAL CONTRACTOR IN ESTABLISHING AREAS REQUIRING DISCONNECTION, REMOVAL, OR RELOCATION OF ELECTRICAL EQUIPMENT, OUTLETS, WIRING, DEVICES, FIXTURES, ETC. AND DO NOT INDICATE ALL OUTLETS, EXACT QUANTITIES OR EXTENT OF DEMOLITION AND RECONNECTION WHICH MAY BE REQUIRED. THE ELECTRICAL CONTRACTOR SHALL VISIT THE JOBSITE AND THOROUGHLY EXAMINE ALL REQUIRING DEMOLITION WORK AND INCLUDE ALL LABOR AND INCIDENTALS WHICH MAY BE NECESSARY TO PERFORM DEMOLITION RECONNECTION AND TEMPORARY POWER CONNECTIONS IN HIS BID.

B DEMOLITION WORK SHALL BE ACCOMPLISHED IN PHASES THROUGHOUT THE CONSTRUCTION PERIOD. ALL DEMOLITION WORK SHALL BE COORDINATED WITH THE GENERAL CONTRACTOR AND OWNER. THE ELECTRICAL CONTRACTOR SHALL OBTAIN THE DEMOLITION SCHEDULE FROM THE GENERAL CONTRACTOR AND MAKE ALLOWANCES IN HIS BID FOR A PHASED DEMOLITION SCHEDULE, INSTALLATION AND/OR RELOCATION OF NEW OR EXISTING FIXTURES AND EQUIPMENT WHICH MAY REQUIRE IN BID TO ALLOW FOR AFTER HOURS CONSTRUCTION WORK AS DIRECTED BY THE GENERAL CONTRACTOR. NO ADDITIONAL COMPENSATION WILL BE ALLOWED FOR OVERTIME.

C THE ELECTRICAL CONTRACTOR SHALL REMOVE FROM THE PREMISES AND DISPOSE OF ALL ELECTRICAL DEMOLISHED EQUIPMENT, FIXTURES, ETC. VERIFY LOCAL AGENCY REQUIREMENTS PRIOR TO BIDDING.

D THE FACILITY SHALL REMAIN OPEN DURING NORMAL BUSINESS HOURS THROUGHOUT THE DURATION OF THE CONSTRUCTION PROCESS. STORE LIGHTING AND POWER MUST BE MAINTAINED DURING NORMAL STORE OPERATING HOURS. SCHEDULE ANY POWER OUTAGES WITH SAFEWAY (7) SEVEN DAYS IN ADVANCE AND RECEIVE APPROVAL PRIOR TO PROCEEDING. THE ELECTRICAL CONTRACTOR SHALL BE RESPONSIBLE FOR MAINTAINING CONTINUITY IN ELECTRICAL SEVICE AND MAKE ALLOWONCES IN HIS BID FOR TEMPORARY WIRING, CONNECTIONS AND POWER AS REQUIRED TO MINIMIZE DISRUPTION OF SERVICES. COORDINATE REQUIREMENTS WITH GENERAL CONTRACTOR AND OWNER.

E COORDINATE THE ELECTRICAL DEMOLITION WORK WITH THE GENERAL CONTRACTOR AND ALL OTHER TRADES AT THE JOBSITE. THE ELECTRICAL CONTRACTOR SHALL BE RESPONSIBLE FOR CLEARLY IDENTIFYING ALL CONDUITS, WIRING AND EQUIPMENT WHICH MUST BE MAINTAINED TO PREVENT DAMAGE TO ELECTRICAL CIRCUITS AND EQUIPMENT BY THE DEMOLITION WORK OF OTHER TRADES. NO ADDITIONAL COMPENSATION WILL BE ALLOWED FOR REPAIR OR REPLACEMENT OF ELECTRICAL CIRCUITS AND/OR EQUIPMENT DAMAGED BY THE DEMOLITION WORK OF OTHERS RESULTING FROM THE FAILURE OF THE ELECTRICAL CONTRACTOR TO CLEARLY IDENTIFY SAID CIRCUITS OR EQUIPMENT.

F THE ELECTRICAL CONTRACTOR SHALL REMOVE AND DISPOSE OF ALL ABANDONED CABLES, CONDUIT, WIRE, BOXES, FITTINGS AND HANGING MATERIALS FOR ELECTRICAL EQUIPMENT ABOVE EXISTING CEILINGS. REMOVAL SHALL CONTINUE THROUGHOUT CONSTRUCTION AS EQUIPMENT AND CIRCUITS ARE DISCONNECTED.

STATEMENT OF PURPOSE

THE PURPOSE OF THE SEISMIC RETROFIT MODIFICATIONS ASSOCIATED WITH THIS SHEET AND ASSOCIATED SET OF PLANS IS ONLY TO INCREASE THE CAPACITY OF VARIOUS LATERAL LOAD RESISTING ELEMENTS OF THE NOTED BUILDING. ALL NEW STRUCTURAL ELEMENTS ARE TO BE DESIGNED PER THE STANDARDS SET FORTH IN THE 2013 EDITION OF THE CALIFORNIA BUILDING CODE. THESE MODIFICATIONS ALONE WILL NOT NECESSARILY BRING THE OVERALL BUILDING INTO COMPLIANCE WITH THE SEISMIC STANDARDS SET FORTH IN THIS BUILDING CODE, AND WILL NOT NECESSARILY PREVENT DAMAGE FROM OCCURRING IN THIS BUILDING DURING AN EARTHQUAKE. THESE MODIFICATIONS ARE NOT NECESSARILY TO BE CONSIDERED A COMPLETE SEISMIC RETROFIT OF THE BUILDING.

STATEMENT OF PURPOSE

THE PURPOSE OF THE SEISMIC RETROFIT MODIFICATIONS ASSOCIATED WITH THIS SHEET AND ASSOCIATED SET OF PLANS IS ONLY TO INCREASE THE CAPACITY OF VARIOUS LATERAL LOAD RESISTING ELEMENTS OF THE NOTED BUILDING. ALL NEW STRUCTURAL ELEMENTS ARE TO BE DESIGNED PER THE STANDARDS SET FORTH IN THE 2013 EDITION OF THE CALIFORNIA BUILDING CODE. THESE MODIFICATIONS ALONE WILL NOT NECESSARILY BRING THE OVERALL BUILDING INTO COMPLIANCE WITH THE SEISMIC STANDARDS SET FORTH IN THIS BUILDING CODE, AND WILL NOT NECESSARILY PREVENT DAMAGE FROM OCCURRING IN THIS BUILDING DURING AN EARTHQUAKE. THESE MODIFICATIONS ARE NOT NECESSARILY TO BE CONSIDERED A COMPLETE SEISMIC RETROFIT OF THE BUILDING.

Construction shall be type 430 stainless steel, with a #3 or #4 polish where exposed. The manufacturer, ETL and NSF shall determine the individual component construction. Construction shall be dependent on the structural application to minimize distortion and other defects. All seams, joints and penetrations of the hood enclosure to the lower outermost perimeter that directs and captures grease-laden vapor and exhaust gases shall have a liquid-tight continuous external weld in accordance with NFPA 96. The hood shall be wall type with a minimum of four connections for hanger rods. Connectors shall have 9/16" holes pre-punched in 1 ¼" x 1 ¼" angle iron at the factory to allow for hanger rod connection by others.

The hood shall be furnished with U.L. classified filters, supplied in size and quantity as required by ventilator.
The filters shall extend the full length of the hood and the filler panels shall not be more than 6' in width.

The hood manufacturer shall supply complete computer generated submittal drawings including hood sections view(s) and hood plan view(s). These drawings must be available to the engineer, architect and owner for their use in construction, operation and maintenance.

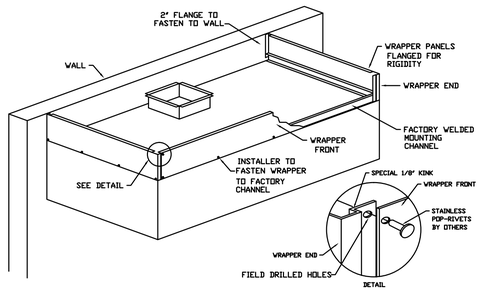
Exhaust duct collar to be 4" high with 1" flange. Duct sizes, CFM and static pressure requirements shall be as shown on drawings. Static pressure requirements shall be precise and accurate; air velocity and volume information shall be accurate within 1-ft increments along the length of the ventilator.

U.L. incandescent light fixtures and globes shall be installed and pre-wired to a junction box. The light fixtures shall be installed with a maximum of 4'0" spacing on center and allow up to a 100 watt standard light bulb.

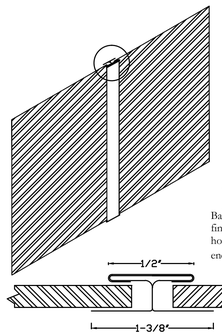
The hood shall have:
- A double wall insulated front to eliminate condensation and increase rigidity. The insulation shall have a flexural modulus of 475 EI, meet UL 181 requirements and be in accordance with NFPA 90A and 90B.
- An integral front baffle to direct grease laden vapors toward the exhaust filter bank.
- A built-in wiring chase provided for outlets and electrical controls on the hood face and shall not penetrate the capture area or require an external chase way.
- Removable grease cup for easy cleaning.

The hood shall be ETL Listed as "Exhaust Hood Without Exhaust Damper", NSF Listed and built in accordance with NFPA 96.

The hood shall be listed for 450°F cooking surfaces at 150 CFM/ft, 600°F cooking surfaces at 200 CFM/ft, and 700°F cooking surfaces at 250 CFM/ft. The hood shall be ETL Listed as "Exhaust Hood Without Exhaust Damper".



FIELD WRAPPER



Stainless Steel Backsplash and Sidesplash

Backsplash is to be manufactured from #3 or #4 finish S/S of the same guage and material as the hoods. It will be supplied with Batton strips and end strips as needed to close all seams and edges.

System Design Verification (SDV)

If ordered, CAS Service will perform a System Design Verification (SDV) once all equipment has had a complete start up per the Operation and Installation Manual. Typically, the SDV will be performed after all inspections are complete.

Any field related discrepancies that are discovered during the SDV will be brought to the attention of the general contractor and corresponding trades on site. These issues will be documented and forwarded to the appropriate sales office. If CAS Service has to resolve a discrepancy that is a field issue, the general contractor will be notified and billed for the work. Should a return trip be required due to any field related discrepancy that cannot be resolved during the SDV, there will be additional trip charges.

During the SDV, CAS Service will address any discrepancy that is the fault of the manufacturer. Should a return trip be required, the general contractor and appropriate sales office will be notified. There will be no additional charges for manufacturer discrepancies.

GENERAL NOTES - SEISMIC BRACING OF DUCTS

1. ALL RECTANGULAR AND OVAL DUCTS 6 SQUARE FEET OR LARGER SHALL BE SEISMICALLY BRACED, EXCEPT AS NOTED BELOW.
2. ALL ROUND DUCTS WITH A DIAMETER OF 28 INCHES OR LARGER SHALL BE SEISMICALLY BRACED, EXPECT AS NOTED BELOW.
3. DUCTS INSTALLED WITHIN 12 INCHES OF SUPPORT STRUCTURE, MEASURED TO THE TOP OF THE DUCT, NEED NOT BE BRACED LATERALLY, WHERE THE HANGERS ARE DETAILED TO AVOID BENDING OF THE HANGERS AND THEIR CONNECTIONS.
4. AS A MINIMUM THE BRACES SHALL BE LOCATED AT EACH END OF THE DUCT RUN, WHERE DUCT CHANGES DIRECTION, AND AT INTERSECTIONS OF DUCTS.
5. THE TRANSVERSE BRACING OF A DUCT RUN SHALL NOT BE SPACED FURTHER APART THAN 30 FEET. THE LONGITUDINAL BRACING OF A DUCT RUN SHALL NOT BE SPACED FURTHER APART 60 FEET.
6. WHERE PRACTICAL, LOCATE LATERAL BRACES WITHIN 24 INCHES OF ELBOWS OR INTERSECTIONS OF THE DUCTS. THIS ENABLES ONE BRACE TO ACT AS TRANSVERSE BRACE FOR THE DUCT RUN IN ONE DIRECTION AND LONGITUDINAL BRACE FOR THE DUCT RUN IN THE OTHER DIRECTION. This form is to be used by the designer and attached to the plans. Listed below are all the acceptance tests for mechanical systems. The designer is required to check the applicable boxes by all acceptance tests that apply and list all equipment that requires an acceptance test. If all equipment of a certain type requires a test, list the equipment description and the number of systems. The NA number designates the Section in the Appendix of the Nonresidential Reference Appendices Manual that describes the test. Since this form will be part of the plans, completion of this section will allow the responsible party to budget for the scope of work appropriately.

Enforcement Agency:
Systems Acceptance. Before occupancy permit is granted for a newly constructed building or space, or a new space-conditioning system serving a building or space is operated for normal use, all control devices serving the building or space shall be certified as meeting the Acceptance Requirements for Code Compliance.

Systems Acceptance. Before occupancy permit is granted. All newly installed HVAC equipment must be tested using the Acceptance Requirements. .
The NRCC-MCH-04-E form is not considered a completed form and is not to be accepted by the building department unless the correct boxes are checked. The equipment requiring testing, person performing the test (Example: HVAC installer, TAB contractor, controls contractor, PE in charge of project) and what Acceptance test must be conducted. The following checked-off forms are required for ALL newly installed and replaced equipment. In addition a Certificate of Acceptance forms shall be submitted to the building department that certifies plans, specifications, installation certificates, and operating and maintenance information meet the requirements of Section 10-103(b) and Title 24 Part 6. B. PROCESS ACCEPTANCE FORMS

(check box for required forms)

Designer:
This form is to be used by the designer and attached to the plans. Listed below are all the acceptance tests for process systems. The designer is required to check the applicable boxes for all acceptance tests that apply and list all equipment that requires an acceptance test. If all equipment of the same type requires a test, list the equipment description and the number of systems.

Installing Contractor:
The contractor who installed the equipment is responsible to either conduct the acceptance test them self or have a qualified entity run the test for them. If more than one person has responsibility for the acceptance testing, each person shall sign and submit the Certificate of Acceptance applicable to the portion of the construction or installation for which they are responsible.

Enforcement Agency:
Plancheck – The NRCC-PRC-01-E form is not considered a completed form and is not to be accepted by the building department unless the correct boxes are checked.
Inspector - Before occupancy permit is granted all newly installed process systems must be tested to ensure proper operations.

RECYCLED WATER SYSTEM:

1. Background: Redwood City's Recycled Water Project provides disinfected tertiary recycled water to City customers for landscape irrigation and a variety of Title 22 approved non–potable uses including dust control, car washing, concrete mixing and other industrial uses.

Redwood City adopted a Recycled Water Use Ordinance in July 2008 that established the recycled water service area and requirements for use within the service area. The Ordinance identifies the required and voluntary uses of recycled water, including requirements for dual plumbing.

2. Project Description: Describe the building in greater detail, include the location of the building, number of stories, rooms, offices, conference rooms, dining room, bathrooms kitchens laundry facility's etc. on each floor. Redwood City will provide potable and recycled water service to the site.

3. Water Supply: Redwood City is the purveyor of both potable and recycled water supplies to the facility. Distribution piping of all water supplies will be labeled accordingly. The following sections provide an overview of the potable and recycled water services.

c) The specific boundaries of the proposed use area including a map showing the location of each facility to be served,
d) The person or persons responsible for operation of the dual plumbed system at each facility, and
e) The specific use to be made of the recycled water at each facility.

Example: Two new laterals will be constructed to provide potable water service to the Center – a 6–inch lateral from Main st and a 6–inch lateral from Birch St. A separate water meter will be installed on each lateral. Water in each lateral will pass through its own reduced pressure principle assembly backflow device.

3.2 Recycled Water Service: Section 60314 Report Submittal 2A–E: Describe in detail the recycled water lateral line(s) leading from the street to the building. Include the lateral line size street name and all devices recycled water will pass through before entering the building.

§60315. Design requirements.
The public water supply shall not be used as a backup or supplemental source of water for a dual–plumbed recycled water system unless the connection between the two systems is protected by an air gap separation which complies with the requirements of sections 7602 (a) and 7603 (a) of title 17, California Code of Regulations, and the approval of the Public water system has been obtained.

3.3 Water System Pressure: Water system pressure may vary, the use of pumps may be required, system pressure of the potable water system and recycled water system should be included in this section ; attachments if available.

3.4 Hot Recycled Water Supply: Hot recycled water may be used for commercial laundry, industrial boiler feed. Use(s) shall be listed in this section.

3.5 Distribution System: The potable and recycled water systems will be separate and installed with no cross connections. Each system will be labeled according to Redwood City's Recycled Water Customer Guidelines. Description of pipe identification can be found on (appendix B). Layout(s) shall be included of the recycled and potable water distribution lines. A description of how the potable and recycled water pipelines run throughout the building shall be included in this section.

(1) Non–potable water pipelines must be appropriately labeled with a yellow background and black lettering having the words "NON–POTABLE WATER – DO NOT DRINK" visible in contrasting letters.

Exposed valve boxes, vaults, quick coupling valves, outlets and related appurtenance must be color– coded, labeled or tagged, to differentiate recycled water from potable water:
(1) ?For potable water: "POTABLE WATER" in white lettering on a blue background.
(2) For recycled water: "CAUTION – RECYCLED WATER – DO NOT DRINK" in black or white contrasting lettering on a purple background.
(3) For non–potable water: "NON–POTABLE WATER – –– DO NOT DRINK" in contrasting lettering on a yellow background
Tags must be identified with the appropriate wording on both sides. Tags identifying recycled water must have both the appropriate wording and the "Do Not Drink" symbol
5.2 Buried Water Piping
New Pipes:
1) All buried potable lines must be identified by continuous lettering on 3–inch minimum width blue tape with 1–inch white lettering bearing the wording "POTABLE WATER" permanently affixed at 10 foot intervals atop all horizontal piping, laterals and mains.
• Identification tape must extend to all valve boxes, vaults and exposed piping.
• Identification tape is not necessary for extruded blue–colored PVC with continuous wording "POTABLE WATER" printed in contrasting lettering on opposite sides of the pipe.
2) Buried recycled water piping must be purple colored and continuously marked with the wording "RECYCLED WATER – DO NOT DRINK" on opposite sides of the pipe.
• Tape that is at least 3–inches in width and runs continuously along the length of the pipe containing the words "RECYCLED WATER – DO NOT DRINK" is an acceptable alternative to printed pipe.
• The letters must be at least 1–inch in height and either black or white contrasting lettering.
• The tape must be permanently secured to the top of all pipes, mains and laterals.

Existing Pipes:
3) Existing piping need not be marked unless exposed during construction or maintenance. The exposed section of pipe should be appropriately marked as "POTABLE WATER" to the extent feasible.
4) Existing piping need not be marked unless exposed during construction or maintenance. The exposed section of pipe should be marked as "RECYCLED WATER– DO NOT DRINK" to the extent feasible.
5.3 Purple Wrapping Tape Specifications
Where it is not feasible to use purple pipe, exposed recycled water pipes should be wrapped with purple tape. Wrapping should be as follows:
2) Tape shall be fabricated of polyvinyl chloride with a synthetic rubber adhesive and a clear polypropylene protective coating or approved equal.
3) Wrapping tape shall have a minimum nominal thickness of five ten–thousandths (0.0005) inch and a minimum width of two 2 inches.
4) Tape must be purple in color and shall be imprinted in nominal 1/2 inch high black, uppercase letters, with the words "CAUTION: RECYCLED WATER – DO NOT DRINK".
o The lettering shall be imprinted in two 2 parallel lines, such that after wrapping the pipe with 1/2 width overlap, 1 full line of text shall be visible.
5) Wrapping tape is not required for buried PVC pipe manufactured with purple color integral to the plastic and marked on opposite sides to read "CAUTION: RECYCLED WATER – DO NOT DRINK" in intervals not to exceed three 3 feet.

Recycled water appurtenances must be identified with tags or labels as belonging to the recycled water system. Recycled water tags or labels must have a purple background with black lettering stating "RECYCLED WATER – DO NOT DRINK," and a "Do Not Drink" symbol.

Potable water appurtenances located near recycled water should be tagged or labeled as part of the potable water system. Labels must have a blue background with "POTABLE WATER" in white lettering.
Examples of appurtenances that must be identified are:
• Valves: Including air/vacuum relief valves, pressure reducing valves, pump control valves, etc.
• Pumps
• Pressure regulators
• Flow meters
• Quick couplers
• Strainers
• Other related components (i.e. trap primers, shock arresters)
• Tank–type water closets that are flushed with reclaimed water shall be labeled: "RECYCLED WATER_ DO NOT DRINK"

5.5 Valves
All valves must have an identification tag on the valve operator. Additionally quick coupling valves must also be installed in a valve box with the valve box cover imprinted with the words "RECYCLED WATER".

5.6 Valves and Mechanical Equipment
1) All valves, except fixture supply control valves, shall be equipped with a locking feature.
2) All mechanical equipment, which is appurtenant to the recycled water system, shall be painted purple to match the wrapping tape.

5.7 Valve Seals
Seal each valve or appurtenance after the reclaimed system has been approved, and placed into operation. These seals shall either be a crimped lead wire seal, or a plastic break–away seal which, if broken after system approval, shall be deemed conclusive evidence that the reclaimed water system has been accessed. The seals should be purple with the words "RECYCLED WATER".

6. Operation:

6.1 Site Supervisor: Each Site must designate a Site Supervisor will be responsible for operation of the on–site water and recycled water systems. The Site Supervisor will be the City's point of contact for the recycled water system and will be involved with monitoring and maintaining the system. The Site Supervisor will be responsible for conducting and submitting all monitoring reports to the City, and will be present for all cross connection inspections and testing.

6.2 Self– Monitoring Reports: Redwood City requires all recycled water users to prepare and submit monthly monitoring reports. Dual Plumbed building monitoring reports include the annual inspection requirements identified in Chapter 16A of the 2013 California Plumbing Code (as may be updated from time to time), as well as site specific requirements as determined by Redwood City. Section 8.3 lists the annual inspection requirements that will be incorporated into the monthly self –monitoring report.

7. Cross Connection Testing and Inspection: Existing Title 22 regulations require an annual visual inspection of the dual plumbed system for possible cross connections between the recycled and potable water systems. The recycled water system must also be tested at least once every four years for possible cross connections. Both the inspections and testing must be conducted by a certified cross connection control specialist.

7.1 Overview of Redwood City's Cross Connection Program: The City has an adopted Cross Connection Control Program that originated in 2008 (Ordinance No. 2331) and was amended in 2013 (Ordinance No. 2391). A copy of Ordinance No. 2391 is included as Appendix A. The terms of the Ordinance are incorporated into Article VII of the City's Municipal Code. The Code includes the requirements for separation of the potable and non–potable water systems, backflow device installation and testing, and air gap separation, as well as cross connection prohibition. The Code also specifies customer/user responsibilities for testing.

Recycled water customers are responsible for contracting with a certified Cross Connection Control Specialist to perform the annual visual inspections and the annual cross connection test. The City will mail a reminder to customers that will include directions for submitting test results to the City. The City maintains a database of all cross connection testing. A City representative will be present at all visual inspections and cross connection tests.

7.2 Initial Cross Connection Test: Prior to delivering recycled water to the site, the City the City will conduct two tests: 1) Full– shut down test; and 2) Cross Connection Test as described in Appendix B.
The Full–Shut Down test will be conducted by the Contractor under direction and in the presence of City staff. The test will consist of two parts. Part 1 will consist of pressurizing the potable water system and de–pressurizing the recycled water system. Part 2 will consist of pressurizing the recycled water system and de–pressurizing the potable water system.

1. Pressurization of the potable water system and de–pressurization of the Recycled water system.
2. Verification of flow from the potable water outlets and absence of flow from the Recycled water system outlets.
3. Pressurization of the Recycled water system and de–pressurization of the potable water system.
4. Verification of flow from the Recycled water outlets and absence of flow from the potable water system outlets.

7.2.1 §60316. Operation requirements.
(a) Prior to the initial operation of the dual–plumbed recycled water system and annually thereafter, the Recycled Water Agency shall ensure that the dual plumbed system within each facility and use area is inspected for possible cross connections with the potable water system. The recycled water system shall also be tested for possible prior to the delivery of recycled water to the facility.
cross connections at least once every four years. The testing shall be conducted in accordance with the method described in the report submitted pursuant to section 60314. The inspections and the testing shall be performed by a cross connection control specialist certified by the California–Nevada section of the American Water Works Association or an organization with equivalent certification requirements. A written report documenting the result of the inspection or testing for the prior year shall be submitted to the department within 30 days following completion of the inspection or testing.

(b) The recycled water agency shall notify the department of any incidence of backflow from the dual–plumbed recycled water system into the potable water system within 24 hours of the discovery of the incident.

7.3 Annual Cross Connection Test
The City will conduct a Cross Connection Inspection and Test annually in coordination with the Site Supervisor. The customer will hire a cross connection control specialist to perform the Annual Visual Inspection. The visual inspection will be conducted In accordance with the Visual Inspection Checklist included in the City's Recycled Water User Guidelines.
The Annual Visual Inspection will be conducted by a certified Cross Connection Control Specialist and will be performed in the presence of the Site Supervisor and City staff. The inspection will include a check of the following:
1. Meter locations of the recycled water and potable water lines to verify that no modifications were made, and that no cross–connections are visible
2. All pumps and equipment, equipment room signs, and exposed piping in the equipment room.
3. All valves to ensure that valve lock seals are still in place and intact.
4. All valve control door signs shall be checked to verify that no signs have been removed. If the visual inspection indicates that the recycled water plumbing has been modified, a Cross–Connection Test is required

7.4 Required 4 year Shut down Test

§60314. Report submittal. (3) The methods to be used by the recycled water agency to assure that the installation and operation of the dual plumbed system will not result in cross connections between the recycled water piping system and the potable water piping system. This shall include a description of pressure, dye or other test methods to be used to test the system every four years.

All dual plumbed buildings are required to perform a full Cross Connection test every 4 years. Inspection may occur more frequent if required by the State, the site has history of violations or cross connections. Currently, a full shut down test is the only approved Cross Connection method in Redwood City. Alternative methods for a Cross Connection test must submitted along with the testing procedures to the State Water Resource Board.

Rinnai

MSB Kits for Connecting Multiple Water Heaters

The MSB kits can electronically connect up to 25 water heaters.

For proper operation, it is not recommended that different models be connected together. Combining different models may result in lower performance.

Models

For use with Rinnai Tankless Water Heaters* (except for models V53e, V53i, and R63LSe which must use pressure activation valves, PVA).

System Operation

When multiple water heaters are operating, they will attempt to supply equal amounts of hot water.

The order in which each water heater operates is occasionally rotated to ensure equal usage among the entire system.

On initial water flow demand, 1 to 3 units are in standby which means that their servos valves are open until flow demand is determined. Only the necessary number of water heaters will begin to fire to meet demand. Water heaters not firing will close their valves.

The number of units that are in standby can be determined by a dip switch setting of the master MSB board. It is recommended that the dip switch settings on MSB boards other than the master MSB board be set for 1 unit in standby.

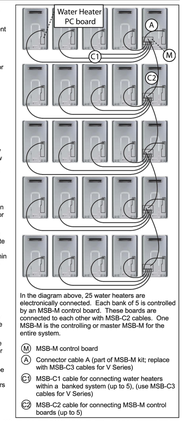
The number of units in standby will affect the activation flow rate. With 3 units in standby, the activation flow rate is 3 times the rate for a single water heater. If the activation flow rate for a single water heater is 0.4 gal/min then for a system with 3 waters heaters in standby, the activation flow rate will be 1.2 gal/min.

Temperature

The temperature setting for all of the connected water heaters is controlled by the temperature controller connected to the water heater with the master MSB Board. Temperature controllers connected to the other units will provide maintenance codes for their respective units.

If water heaters do not use a temperature controller, the temperature will be that temperature setting of the water heater with the master MSB board (120°F or 140°F).

On applicable models (VA, VB), a single MCC-91 can be connected to the master MSB Board to provide temperatures greater than 140°F for all the water heaters in the MSB system.



In the diagram above, 25 water heaters are electronically connected. Each bank of 5 is controlled by an MSB-M control board. These boards are connected to each other with MSB-C2 cables. One MSB-M is the controlling or master MSB-M for the entire system.

- (M) MSB-M control board
- (A) Connector cable A (part of MSB-M kit; replace with MSB-C3 cables for V Series)
- (C1) MSB-C1 cable for connecting water heaters within a banked system (up to 5), (use MSB-C3 cables for V Series)
- (C2) MSB-C2 cable for connecting MSB-M control boards (up to 5)

MSB Kits for Connecting Multiple Water Heaters

MSB Kits - Parts Needed

Use the table to determine the type and number of kits necessary for your system.

Up to 5 water heaters can be connected together using the MSB-M and MSB-C1 kits. When over 5 water heaters are connected together, MSB-M control boards are connected using MSB-C2 kits.

If multiple MSB-M control boards are used, then at least three water heaters should be connected to each MSB-M. Example: With 7 water heaters, one MSB-M should control 4 water heaters and the other MSB-M should control 3 water heaters.

Detailed installation instructions are provided with each of the kits.

* VA, VB, and KA (Condensing) models use the MSB-M, MSB-C1, and MSB-C2 cables

V Series models use the MSB-M, MSB-C2, and MSB-C3 cables. V Series models must use the MSB-C3 cables instead of the MSB-C1 cables and the Cable A in the MSB-M.

** The Rinnai EZConnect™ is less expensive and is specifically designed for connecting 2 water heaters. Applicable models are VA, VB, KA, and V5237.

General Requirements ,Remarks and Tools:
- Confirm that the box contents match the above Parts list.
- Use suitable tools, beware components might have sharp edges
- Assure that the roof is suitable to support the load of the terminal, and that the flashing is installed in the roof according to local codes.
- (Flat roof) The flashing is made of galvanized steel and can be fixed to the roof with suitable sealing material, please refer to the installation instructions of the specific roofer material supplier for further instructions.
- (Pitched roof) The moldable flashing can be installed in a 3/12 to 12/12 roof pitch using standard flaring devices, please refer to the installation instructions of the specific roof material supplier for additional info and instructions
- The vertical termination should be last component installed in the CVent common vent system. The remaining components in vent system must be appropriately supported and assembled before installation of the termination.
- The termination must be securely fastened/strapped to the building structure with the provided (Termination Clamp) beneath the roof flashing. The roof flashing must be installed per local codes and/or the installation instructions of the roof material manufacturer.
- The termination must be located on the roof per the appliance manufacturers installation instructions and in accordance with local codes.

Assembly of terminal
1. Lubricate seal in item 3 (8" Inner Exhaust Assembly) and slide in item 2 (8" Exhaust Extension (Black)) . Confirm full engagement before proceeding.
2. Assemble item 1 (Terminal Cap) to item 5 (Terminal Outer Shell). Confirm full engagement before proceeding.
3. Position item 4 (Terminal Clamp Ring) over the joint between items 1 &5. With the terminal clamp ring in place tighten the clamps with a flathead screwdriver. Do not over-tighten the clamps as this could cause damage of the termination components.
4. Insert the items 2&3 assembled in step 1 into the outer shell assembly (Items 1,4 & 5). Widen the stainless steel spacers as needed, to ensure the centering of the vent pipe. The black portion must protrude minimum 4 inch over the Terminal Cap.
5. Assemble the Storm Collar above the Terminal Cap and below the exhaust outlet. Use weather proof sealant between the storm collar and black vent extension.
6. (Pitched Roof Installation) slide storm collar [provided with roof flashing] over the terminal to the stop. With a flathead screwdriver, firmly secure the storm collar to the termination shell. Use of weather proof sealant may be applied at this position.
7. Lubricate the mating seal below the roof. Insert the termination into the roof flashing opening and assemble the termination assembly into the socket end of the vent system below the roof. If needed, the 8"transparent vent pipe can be shortened using a fine tooth saw. Always deburr the edges.
8. Confirm the termination is in the vertical position then install item 7 (Termination Clamp) to the structure beneath the roof flashing.
